About the Behavioral Detection Engine

The Behavioral Detection Engine (BDE) introduces a new groundbreaking experience for managing CylanceOPTICS detection rules. The BDE simplifies the administration of detection rules and deployments, and includes a set of new detection rules that have been tuned and vetted by our Threat Intelligence team to protect our customers while lessening alert fatigue by limiting alert noise. The BDE also introduces observations, which is the collection of telemetry data for events that occur below the alert threshold configured for your devices.

The BDE has an improved and streamlined process for managing and deploying detection rules. With alert thresholding and observations, the BDE can enact policies with a much lower level of noise without missing important data that may be hiding in low-efficacy signal. The new experience for managing exceptions allows you to define the conditions once, and then assign the exception to devices using flexible assignment criteria such as a global assignment, zones or device policies. This removes the need to duplicate the exception for each policy in your tenant.

This guide highlights some key considerations to help administrators who are already using legacy rulesets transition to use the BDE. You can also review the [Behavioral Detection Engine Getting Started Guide](#), which includes best practices information.

Behavioral Detection Engine features

There is a list of features and improved experiences included with the BDE:

- **Refreshed content library:** A fully redesigned detection rules library that focuses on maximum coverage across MITRE ATT&CK and high-efficacy threat identification.
- **MITRE metadata tagging:** Events are automatically tagged with MITRE tactics and techniques, enabling faster, more targeted threat investigations and richer AI summaries.
- **Observation rules:** The new observation rule type and alert thresholding ensures high-value telemetry is collected without raising unnecessary alerts. This means that the BDE can enact policies with a much lower level of noise without missing important data that may be hiding in a low-efficacy signal.
- **Streamlined exception management:** A new experience for managing exceptions that is decoupled from the policy and centrally managed across the environment for any use case such as tenant, zones, policies, devices.
- **Easier to maintain:** Simplified AI-assisted workflows through the Alerts View makes it easier to tune exceptions with minimal overhead.
- **Automated updates to detection rules:** Delivers frictionless updates to detection rules libraries, reducing operational risks.

Transitioning to the BDE from the legacy ruleset configuration

It is simple to transition devices to BDE policies from legacy rule sets. After you have created a BDE policy, in the device policy that is assigned to the devices, change the **Detection engine source** setting to **BDE policy** and specify the BDE policy to use. This setting removes the legacy detection rules from the device and loads new detection rules provided by the BDE.

The screenshot shows a configuration interface for 'Detection settings'. Under the heading 'Select detection engine source', there are three radio buttons: 'BDE policy' (which is selected), 'Detection rule set', and 'None'. Below the radio buttons is a dropdown menu with 'BDE policy' selected and 'Recommended configurat...' visible. Under the heading 'Operating mode', there are two radio buttons: 'Alert only' (which is selected) and 'Full enforcement'.

These are the suggested migration steps:

1. Create a BDE policy, and then set the operating mode to "Alert only".
2. Create a new test device policy, and then assign a set of devices from across the organization to it for testing purposes. It is important to include devices from users with different roles so that all applications that are used in your organization are tested.
3. In the test device policy, in the **CylanceOPTICS** settings tab, specify the BDE policy in the **Detection settings** section.
4. On the **Alerts** screen, monitor the alerts for detections triggered by the BDE. Using the **Actions** menu, create exceptions for any alerts with **High** severity and those that may impact devices and users. For example, you may need to add some exceptions for some legitimate business applications so that business continuity is not impacted.
5. When the alerts for this group of test devices do not include any legitimate business applications and no further tuning is required, you can move the devices back to the production device policy.
6. In the BDE policy, enable and configure the automated responses for detection techniques according to the requirements of your organization.
7. In the production device policy, specify the BDE policy from the previous step that has the automated responses enabled, and then set the operating mode to **Full enforcement**.
8. If necessary, create other BDE policies and device policies, and then set and assign the device policies to devices within your tenant accordingly.
9. If widespread business continuity issues arise and devices are impacted, you can set the BDE operating mode from device policy of affected devices to **Alert only**. While in this mode, you can add exceptions and tune your environment to mitigate the impact.

For more information, review the best practices in the [Behavioral Detection Engine Getting Started Guide](#).

Managing exceptions and tuning your environment

Follow the best practices for tuning your environment that are highlighted in the Behavioral Detection Engine Getting Started Guide. You can create BDE exceptions when viewing alerts from the Alerts screen using AI to automatically define conditions, or you can manually create them from the **CylanceOPTICS > Behavioral Detection Engine > Exceptions** tab.

Viewing BDE detections on the Alerts screen

On the **Alerts** screen, detections from the Behavioral Detection Engine (BDE) can be distinguished from detections using the legacy rule sets.

Detections from the legacy rule set have "Custom" or "MitreCA" in the **Classification** column, and the MITRE TTPs in the **Description** column.

PRIORITY ↓	STATUS	CLASSIFICATION	SUB-CLASSIFICATION	DESCRIPTION	KEY INDICATORS
HIGH	NEW	Custom		Win Create Script File Mitre T1059	
HIGH	NEW	Custom		Win Create Script File Mitre T1059	
HIGH	NEW	Custom		Win Create Script File Mitre T1059	
HIGH	NEW	Custom		Win CMD Deleting Sensitive Documents Mitre T1070	

Detections from BDE have the MITRE details in the **Classification** and **Sub-classification** columns.

PRIORITY	STATUS	CLASSIFICATION	SUB-CLASSIFICATION	DESCRIPTION	KEY INDICATORS
MEDIUM	NEW	TA0002 Execution	T1059 Command ...	Non RFC1918 Connection by script	
MEDIUM	NEW	TA0002 Execution	T1059 Command ...	Non RFC1918 Connection by script	
LOW	NEW	TA0002 Executio...	T1053 Scheduled...	Svchost Schedule Task Launches Rundll32	
MEDIUM	NEW	TA0002 Execution	T1059 Command ...	Non RFC1918 Connection by script	

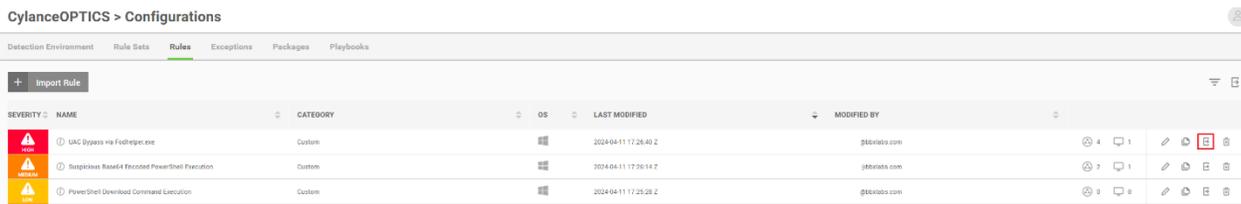

Importing custom rules

The Behavioral Detection Engine supports importing custom detection rules in .json format. In the Cylance console, you can import custom detection rules into custom rule groups from the **CylanceOPTICS > Behavioral Detection Engine > Custom Rules** tab. You can also export legacy rule sets in .json format and import them.

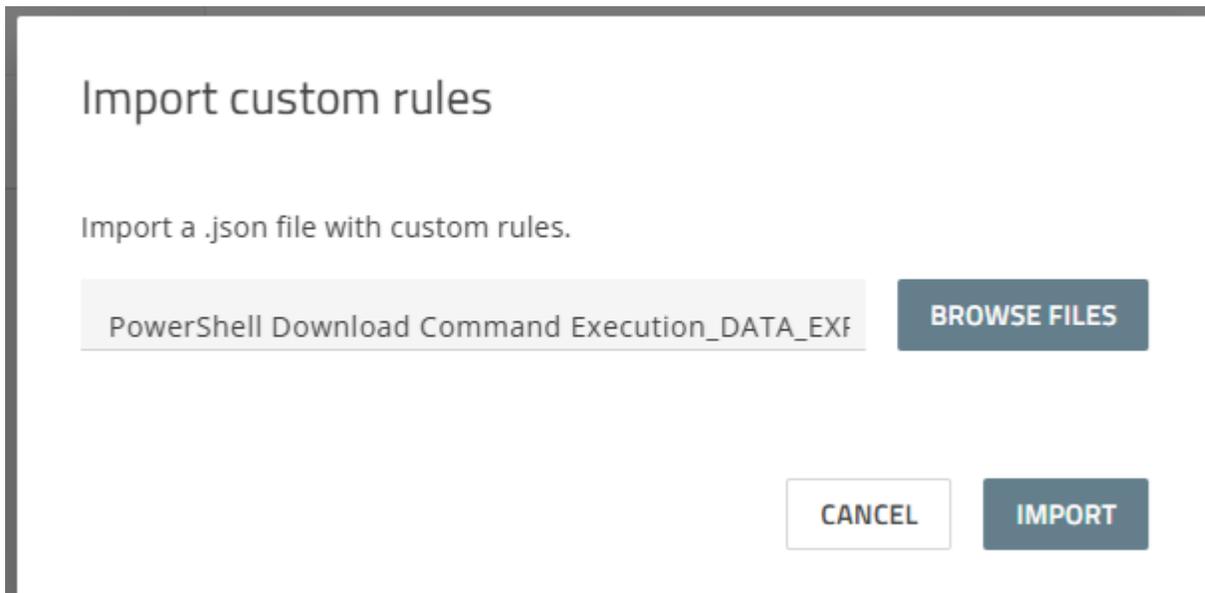

Before you import a custom detection rule, create a custom rule group. The custom rule group that you created appears as a card on the **Custom Rules** screen.

Use these steps to export the legacy rule sets from the Cylance console, create a custom rule group, and then import the legacy rule sets to the custom rule group:

1. Navigate to **CylanceOPTICS > Configurations > Rules**.
2. Beside the rule that you want to export, click **Export** and save the .json file with the rule conditions.

3. Navigate to **CylanceOPTICS > Behavioral Detection Engine > Custom Rules**.
4. In the **Custom Rule** tab, click **Add** and then add a new custom rule group.
5. Click the custom rule group, and then on the right side, click **Add > Import custom rules**, and specify the .json file.

6. Review the imported rule conditions, verify the target custom rule group, and then click **Validate**. After validation, click **Add** to complete the import.

General Information

Priority* **Low** Platform* Windows Custom rule group* imported custom rules

CANCEL VALIDATE ADD

- On the **Behavioral Detection Engine** screen, open the **BDE policy > Detection And Response** tab where you can enable alerts, observations, and automated responses for your custom rules. The custom rule group will appear as a new card at the bottom of the **Detection And Response** tab when editing a BDE policy, under the **Custom rules** section.
